

Kalade koelmualade olukord

Toomas Saat

TÜ Eesti Mereinstituut

Miks on kala vähe?

1. Looduslikud tegurid

- ABIOOTILISED: temperatuur, soolsus, sademed (jõgede veetase) jt
- BIOOTILISED: looduslike vaenlaste arvukus (kormoranid, hülged, muud kalatoidulised linnud ja loomad) jm

2. Inimtekkelised (antropogeensed)

- kalapüük
- eutrofeerumine jm

Kuhu kalad koevad

- 1. Veekihti (kilu, tursk jt)
- **2. Veekogu põhjale**
(kividele, taimedele, liivale jne)
(osa ehitavad selleks “pesi”, osa ka
valvab pesi)
- 3. Kaugelearenenud lõimetishoole
(emakala, meri- ja madunõel)

Piisava järelkasvu saamiseks on vajalik

- - piisav arv suguküpsed kalu
- - sobivad sigimistingimused (norm seisukorras koelmud, mis tagavad kudemise ja loodete normaalse arengu)
- - sobivad keskkonnatingimused koorunud vastsete ja maimude ellujäämiseks (varje, toit, temperatuur...)

Kuidas tagada piisav järelkasv?

- 1. Loodusliku sigimise toetamine
- - koelmualade melioreerimine (setete, taimede eemaldamine; võsa niitmine; veetaseme reguleerimine;...)
- - juurdepääsu tagamine koelmualadele (jõesuudmete avamine, tammid jõgedel, vanajõgede suudmete avamine)
- - tehiskoelmud
- 2. Taastootmine kalakasvatustes, asustamine

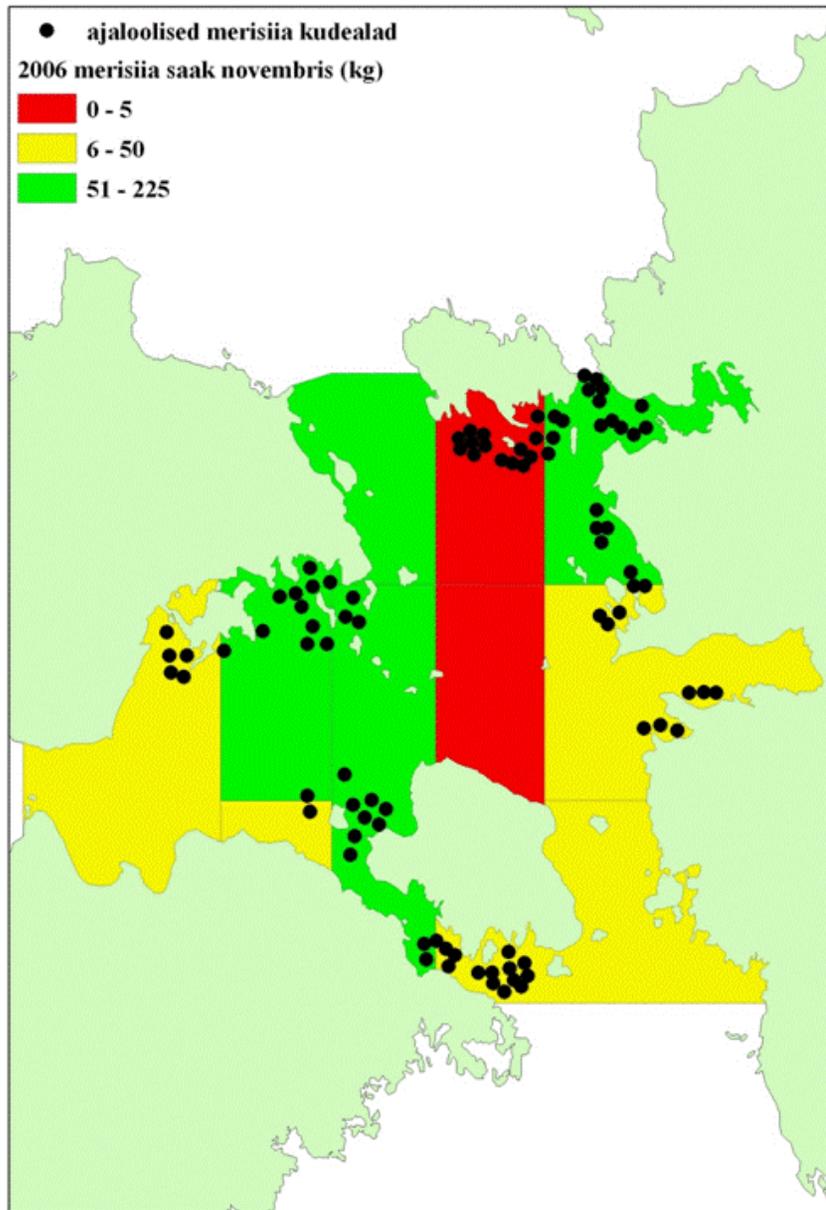

Koelmualade seisund

Enne muude meetmete rakendamist tuleb selgitada, kas koelmute seisund tagab loodusliku sigimise.

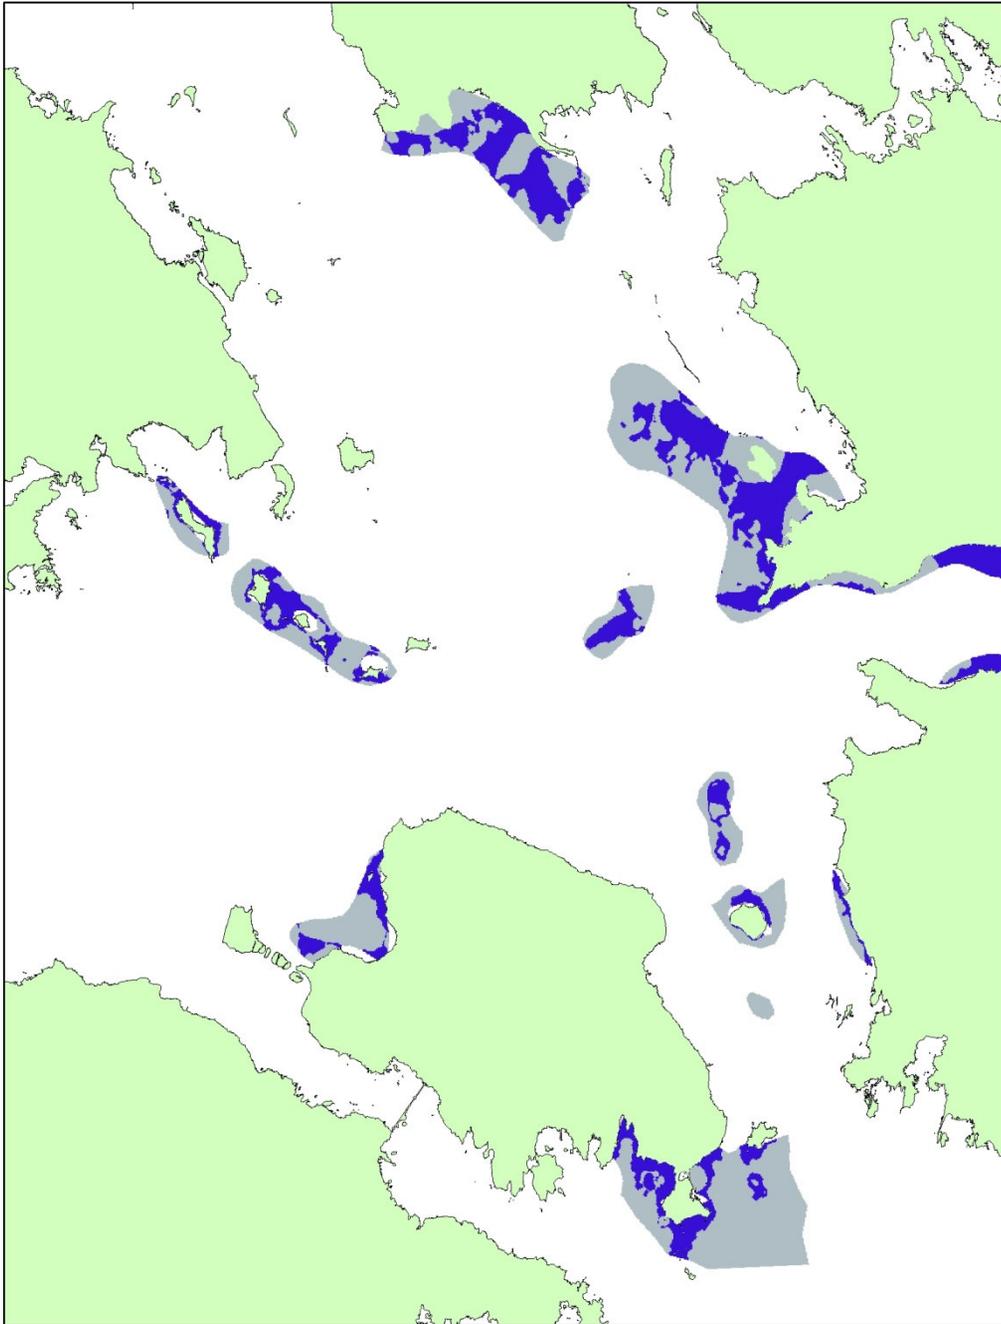

Sageli kulukas, ent igal juhul odavam (positiivse tulemuse saamiseks) kui huupi toimetamine

Koelmualade seisundi hindamine: Sukeldumised

- Kudemissubstraadi olemasolu, seisund
- Koetud “marja” kindlakstegemine ja proovide kogumine loodete arengu normaalsuse selgitamiseks
- Näide: merisiia koelmud Väinameres

Merisiia kudealad Väinamere regioonis. Punktidega on tähistatud ajaloolised 1960–1970ndate merisiia kudealad (Erm jt., 1970). Värvidega on näidatud 2006. aasta novembris kudealadelt püütud merisiig (kg). Punane värv tähistab kudekarja puudumist, kollane kudekarja vähest esinemist ning roheline värv kudekarja olemasolu.

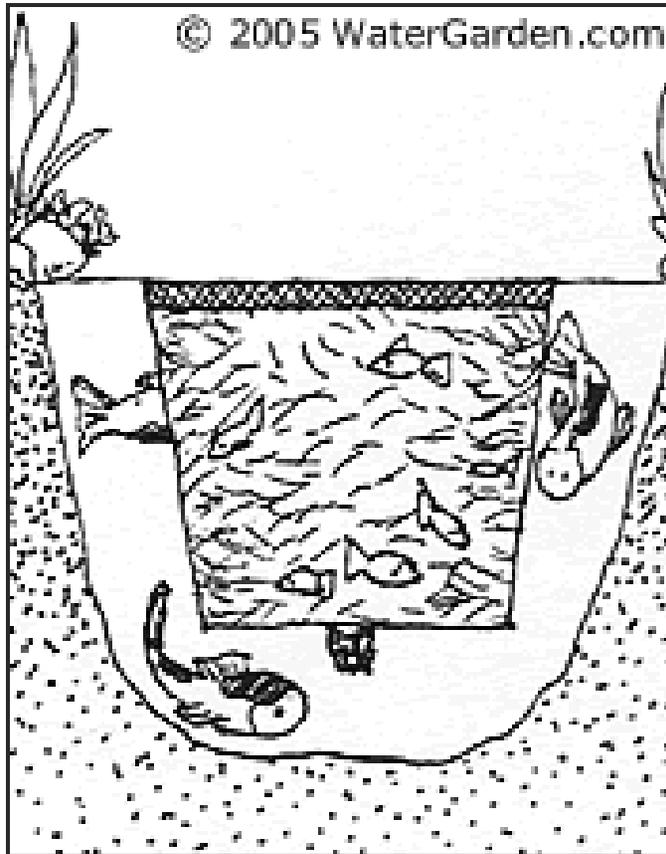

Merisiiale
kudemiseks sobivate
meresetete ja
sügavusega
piirkonnad
Väinamere regioonis.
Sobiva settega alad
on tähistatud halli ja
sinise värviga.
Sinisele värvile
vastab nii meresette
kui ka sügavuse
poolest sobivad
merisiia kudealad.

Muud meetodid koelmute seisundi (kasutamise) hindamiseks

- **Vastsete (larvide) traalimine** (räim)
- **Visuaalne vaatlus** (Sindi tammi alune; jõesuudmed, vanajõgede suudmed, jõeluhad...)
- **Kudepesade loendamine** (lõhe, meriforell)
- **Kunstkoelmud** (koha)

Tehiskoelmud

- Kudemissubstraat
- Koorunud vastsete varjepaigad

Only \$79.99 ea.

Fish Spawning Basket

18 inches Deep

18 inches in Diameter

Provides a place for fish eggs away from adult fish, fry can also hide inside. While raising fish from eggs may be fun, remember that an overpopulated pond leads to problems.

How It Works:

Place the Spawning Basket into the pond water. The top ring will cause the unit to float while the basket extends downward and can be anchored if desired. As the fish lay their eggs many will attach to the exterior of the basket. Within a couple of days you should turn the basket inside out and place back in the pond. The eggs will hatch within the security of the spawning basket where they cannot be eaten by the adult fish

Tehiskoelmute ja –varjete tüübid

1. Katted (varjed)

- looduslikud: uputatud puud, kaldalt vette langetatud puud
- tehismaterjalist: plastik
- rehvid
- puitkonstruktsioonid

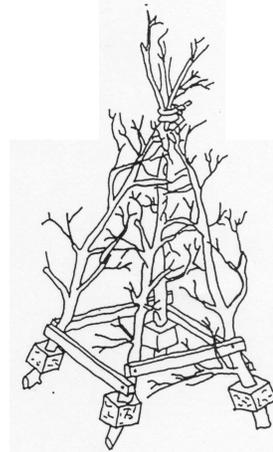

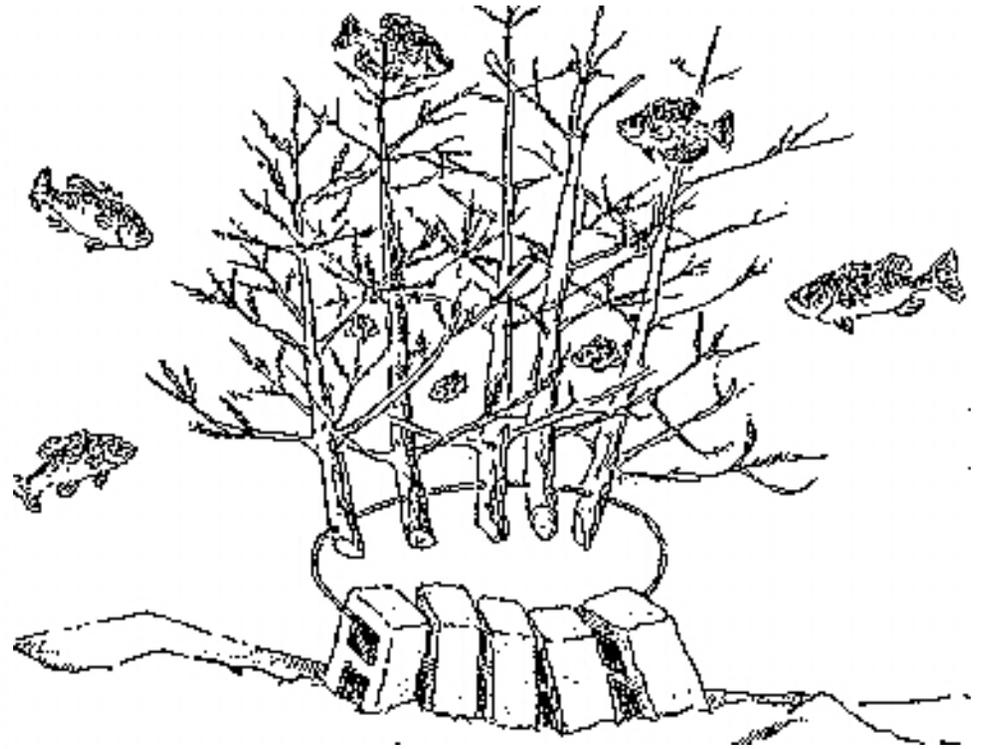

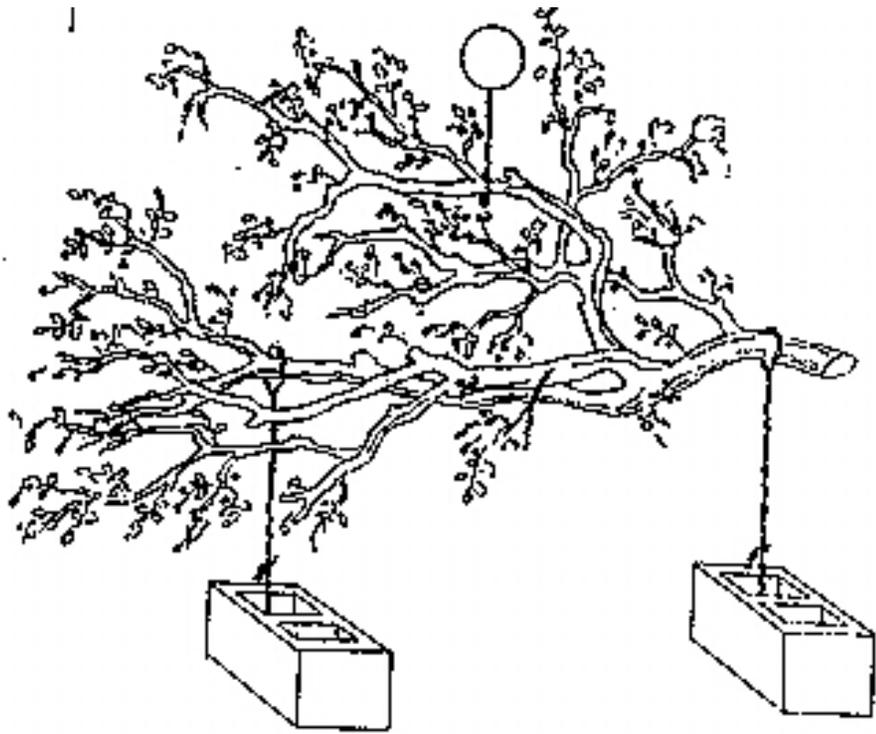

2. Kallast stabiliseerivad struktuurid: lainemurdjad

3. Kudemissubstaat

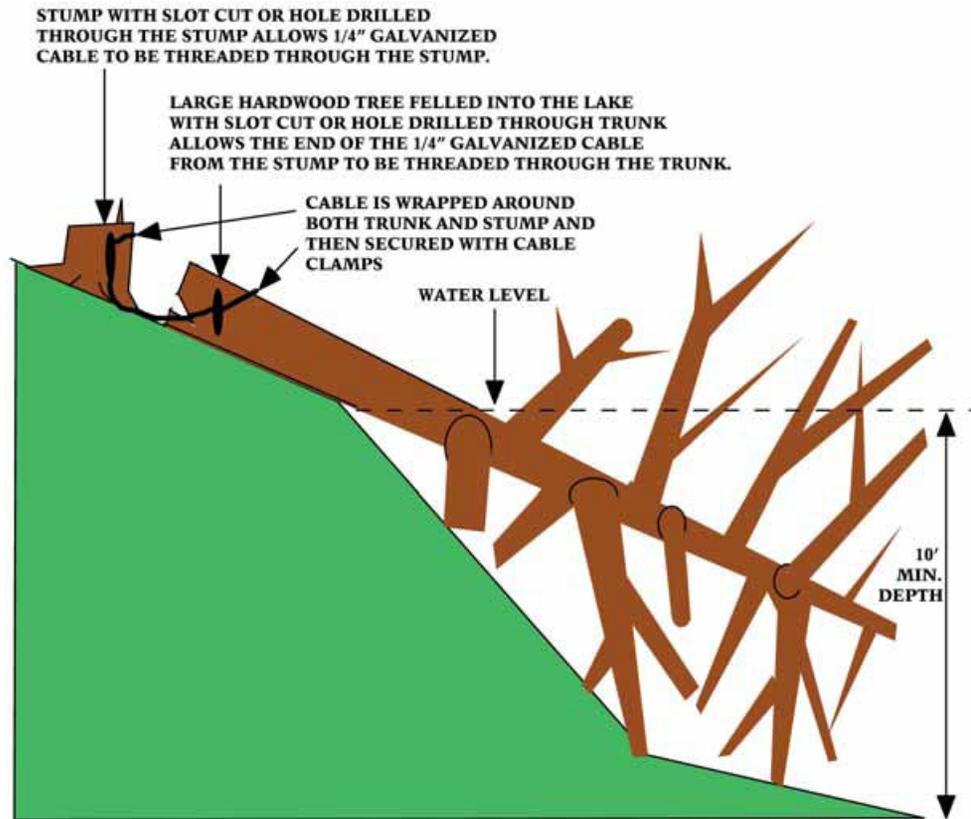

- looduslik: liiv, kruus, kivid
- tehismaterjal: torud/tünnid, pingid, kastid jm

Vette uputatud puud-põõsad

A variety of tree types are used by state agencies depending on availability. These include: ash, cedar, citrus, cottonwood, elm, fir, hickory, juniper, locust, lodgepole, manzanita, mesquite, persimmon, pine, and willow. Some common configurations are pictured below (a-suspended horizontal placement; b-suspended vertical bundle; c-horizontal bundle; d-tepee or pyramid type).

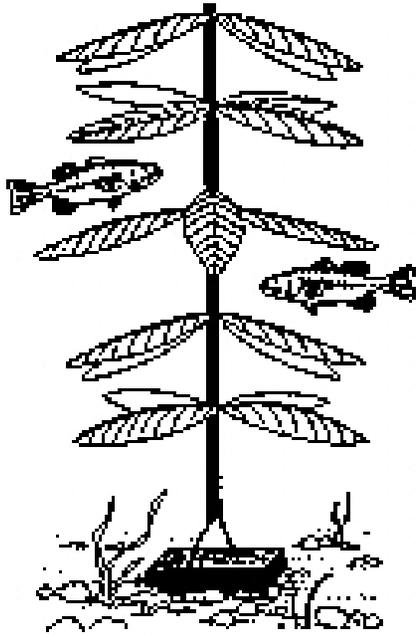

**PENNSYLVANIA STYLE
FELLED SHORELINE TREE
STANDARD DRAWING**

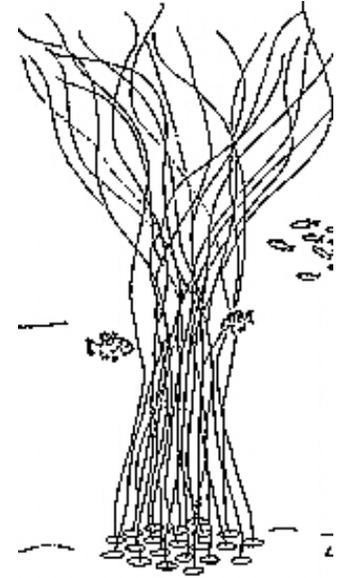

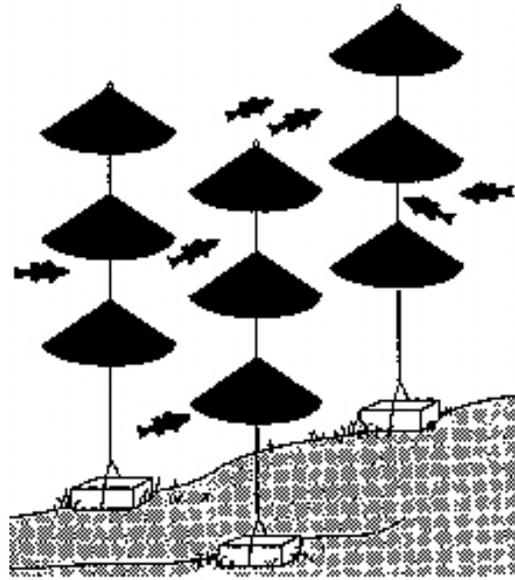

- MATERIALS:**
1 - LARGE SHORELINE HARDWOOD TREE (OAK)
20' - 1/4" GALVANIZED CABLE OR WIRE ROPE
2 - 1/4" CABLE CLAMPS (PINNED ONCE ATTACHED)

Muud

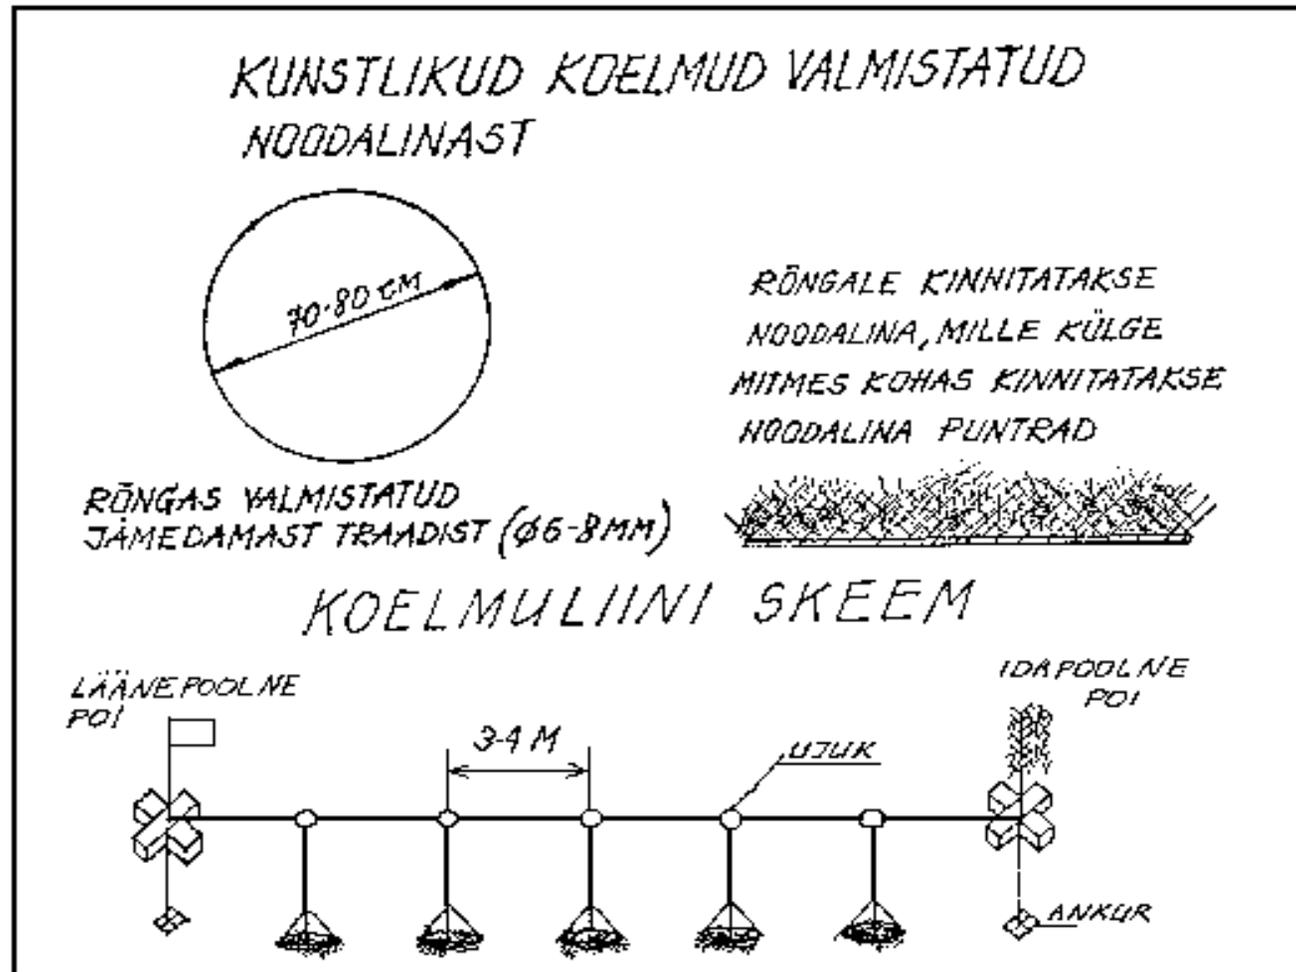

A removable folding net structure that can be placed at any location or depth and removed when/if desired. The structure was chosen because it is reusable and has a low annual cost.
